

## Press Release – Silent Gliss Sliding Panel Systems: 2700 Panel Glide & 2730 Panel Flex

### Flex – The new Panel Glide Generation

Corners become soft curves with the new panel glide systems from Silent Gliss. Innovative technology allows the panels to glide round bends – totally silent and in virtually any radius. Even when used as a visual room divider it is a design statement, there really is no limit to your creativity.

### A Curved Sensation

The first of its kind in the world – the system Silent Gliss 2730 Flex adjusts to every possible room. The tracks and panels can be curved to make a design statement or room divider in any room. The unique flexible carrier incorporating a new designed roller glider ensures a smooth and virtually noiseless movement of the panels.

### Around the Corner

The system Silent Gliss 2730 Flex can be bent to allow the panels to be stacked on the return wall, away from the window. The tracks can be bent to a radius of 15cm which allows the system to be used in rooms with 90° angles, maximising your window space and view.

### Already a Classic – Silent Gliss 2700

This system features a unique carrier incorporating a sophisticated design of rollers and new tracks which allow an even smoother, silent gliding of the panels. Various fabrics, different operation possibilities - like free floating, draw rod and cord drawn operation – along with a new transparent carrier with click-in option make this system truly unique.

System Silent Gliss 2730 used as design statement

Due to the 90° angle, panels can be easily moved and stacked on return walls.
